

Decarbonization Plan for Multinational Corporation

Greene Economics is partnering with Keramida to analyze and potential carbon reduction alternatives and develop a decarbonization plan. Greene Economics is creating a model which forecasts total Scope 1 and Scope 2 greenhouse gas (GHG) emissions based on different combinations of carbon mitigation strategies. The mitigation strategies are being developed through a series of interviews with key firm leaders throughout the global operations. The information is being compiled into a user-friendly model with a dashboard where several assumptions in the model can be quickly altered based on a drop-down menu of options. Given the collection of assumptions selected, results will appear in table and figure format so that users can rapidly evaluate their options.

Greene Economics is developing a decarbonization plan for a large multinational corporation. Greene is assisting the firm assess the most cost-effective pathway to a net-zero carbon emissions status by 2045.
